

563: Research Methods for Human-Centered Design

This course delves into the profound significance of space itself, not only to architecture, but to how individuals and societies organize themselves and their activities.

If you take this course, you will learn theories, calculations, and (easy) computational tools for uncovering spatial patterns that are not readily discernable but that have the capacity to enhance your insights and intuitions about how space works.

This class runs the *first eight weeks* of the fall semester.

Alisha Ther, analysis of Cabrini Green street network, as-is + redesign proposals
